WILDTRAILS

Adventure & Trekking Website

Project Report and Complete Source Code

Prepared from the supplied WildTrails website screenshots

Project scope: introduction, objectives, features, technologies, responsive design, development process, output, advantages, limitations, future improvements, conclusion, and a complete single-file HTML/CSS/JavaScript implementation.

• 11. Conclusion

• 12. Complete Source Code

• Appendix: Supplied Screenshots

1. Introduction

WildTrails is a responsive, outdoor-adventure website concept for presenting trekking routes, camping experiences, trip schedules, packing reminders and safety guidance. The design uses a forest-green and lime palette, large landscape photography, card-based listings and clear calls to action. The supplied screenshots show the main landing page and its supporting sections as one long, navigable website.

The website is intended as a front-end prototype. Its trip names, dates, prices and contact address are sample content; they are not verified offers or live booking availability.

2. Objectives

• Present trekking and camping options in a clear, visually engaging format.

• Help visitors compare difficulty, duration and indicative per-person prices.

• Show an example trip schedule in a structured table.

• Provide an interactive equipment checklist with a packed-item counter.

• Promote responsible outdoor behaviour through safety reminders.

• Offer straightforward navigation and a contact call to action.

• Make the layout usable across desktop, tablet and mobile screen sizes.

3. Main Website Features

Sticky navigation: The WildTrails brand and links to Treks, Camping, Schedule, Checklist and Safety remain accessible while scrolling.

Hero banner: A large mountain background, introductory message and “Explore Adventures” button establish the site identity.

Trekking cards: Three sample routes—Green Valley, Mountain Peak and Summit Quest—show difficulty, duration, description and price.

Camping cards: Forest Camping, Mountain Camping and Adventure Weekend are displayed with photographs and indicative prices.

Trip schedule: A five-column table lists adventure, departure date, duration, difficulty and status.

Equipment checklist: Eight checkboxes allow users to mark essential gear; JavaScript updates the “items packed” count.

Safety guidance: Six concise cards cover weather, personal limits, emergency planning, hydration, nature protection and following a guide.

Call to action: A Contact Us link opens a pre-addressed email draft; the address is a placeholder that must be replaced.

Demo booking feedback: Book buttons show a notice explaining that a booking service must be connected. They do not reserve or charge for a trip.

4. Technologies Used

Technology	Purpose
HTML5	Semantic page structure: header, navigation, main, sections, cards, table, checklist and footer.
CSS3	Colours, typography, spacing, grid layouts, image overlays, hover effects, sticky navigation and responsive breakpoints.
JavaScript (vanilla)	Mobile menu, checklist counter, demo booking notification and automatic footer year.
Unsplash image URLs	Remote landscape photographs used for the hero and cards; internet access is needed to load them.
ReportLab (for this report)	PDF document generation and source-code appendix.

5. Design and Responsive Behaviour

Visual language: forest green communicates the outdoors and reliability; lime green highlights buttons and difficulty badges; cream and pale sage provide calm section backgrounds. White cards, rounded corners and subtle shadows create separation without clutter.

Layout: a centered maximum-width container aligns content. CSS Grid arranges trek/camping cards and safety cards in columns on larger screens. The checklist uses a two-column panel layout. The schedule table can scroll horizontally when the viewport is narrow.

Responsive rules: below 900px, card grids reduce to two columns. Below 680px, the navigation becomes a toggleable menu, content grids become single-column and paddings/font sizes adapt. The viewport meta tag supports device-width rendering. A reduced-motion media query respects users who prefer less animation.

Accessibility details: images have descriptive alt text; the mobile menu exposes its expanded state; checklist progress uses an aria-live region; keyboard focus is visible; and buttons have clear labels. Further accessibility testing is still recommended.

6. Development Steps

• Review the supplied screenshots and identify the shared header, colour palette, section order and content patterns.

• Create a semantic HTML skeleton for the hero, trekking cards, camping cards, schedule, checklist, safety cards and footer.

• Define reusable CSS variables for colours, shadows, spacing and rounded corners.

• Build desktop layouts with CSS Grid and Flexbox, then add tablet/mobile breakpoints.

• Add JavaScript interactions for the responsive menu, checklist counter, booking feedback and dynamic year.

• Add image alt text, focus styles and small-screen overflow handling.

• Test navigation anchors, checkboxes, buttons, layout at different viewport widths and behaviour when external images fail to load.

• Replace sample dates, prices, email address and demo booking actions before real-world publication.

7. Website Output

The final prototype follows the supplied screenshots: a mountain hero at the top, trekking routes on light backgrounds, a dark-green camping section, a trip schedule table, an equipment checklist, six safety cards and a dark call-to-action/footer area. The visual order is intended to guide visitors from discovery to planning and safety.

The screenshots supplied with the request are included in the appendix. The source code in the next section is a self-contained HTML document and can be saved as **index.html**. It uses remote image URLs, so a network connection is needed for the photographs.

8. Advantages

• Simple, attractive design with consistent outdoor branding.

• Visitors can compare trip difficulty, duration and sample prices quickly.

• The checklist is interactive and provides immediate progress feedback.

• Responsive layouts support desktop, tablet and mobile screens.

• Single-file implementation is easy to understand, share and modify.

• Safety and environmental guidance are visible rather than hidden.

9. Limitations

• Booking buttons are demonstrations only; there is no reservation database, payment processing or confirmation workflow.

• Schedule dates and prices are hard-coded sample data and are not connected to live availability.

• The contact email uses a reserved example domain and must be replaced.

• Photographs load from an external image host and may be unavailable offline or subject to external service changes.

• The checklist state is not saved between reloads; refreshing the page resets selections.

• There is no server-side validation, user account, admin panel, search/filter, analytics or content management system.

• The website has not been formally tested across all browsers, devices, assistive technologies or performance conditions.

10. Future Improvements

• Create a backend/API and database for trips, capacity, pricing and departure schedules.

• Implement a secure booking flow with availability checks, booking references, cancellation rules and a payment provider.

• Add an admin dashboard for editing trips, images, dates, safety notices and prices.

• Persist checklist selections with localStorage and optionally allow a printable/downloadable checklist.

• Add route filters for difficulty, duration, region, date and budget.

• Replace placeholder contact details and add a validated enquiry form with spam protection.

• Optimize and locally host images, use responsive image sizes, lazy loading and fallbacks for network failures.

• Perform accessibility checks, cross-browser testing, automated tests and real-user usability testing.

• Add privacy policy, terms, emergency disclaimers and verified local trail/permit information.

11. Conclusion

WildTrails demonstrates how a focused front-end website can combine attractive outdoor imagery with practical planning information. Its key strengths are clear navigation, trek and camping cards, a schedule, an interactive packing checklist and prominent safety guidance. The supplied screenshots are used as the visual reference, while the included source code provides a working starting point. To become a production service, the prototype needs verified content, real booking and contact integrations, persistent data, and broader accessibility and security testing.

12. Complete Source Code

Save the following code as **index.html** and open it in a modern browser. HTML, CSS and JavaScript are all included in the one file. The implementation is a recreated version based on the screenshots, not the original source code of the site.

Note: the image URLs point to Unsplash and require an internet connection. Replace them with licensed local assets if you need offline use or have specific licensing requirements.
